SECTION C : COMPREHENSION

10 MARKS

Read the following passage carefully and answer all the question in complete sentences. Use your own words as far as you can.

DIABETES : TRUE SILENT KILLER.

The world is full of changes and surprises. Diabetes is fast becoming a disease of the young. Ten years ago students were taught that this disease couldn't be found in people less un 40 years. Now it is being

seen in people under 10. The increase of diabetes among youth could sometimes be as a result of genetic predisposition- Weight and environment may also play a role.

As people become busy and work out of home, so also do their eating habits change. There have been a number of changes in foods habits and activity patterns over the last 20 years. These include increase reliance on foods consumed outside the home, increased consumption of soft drinks md fast foods md reduction of physical education in schools.

Diabetes cannot be reversed. Once you have got it, you only have to learn to live with it.

Therefore, it is wise to follow the advice of one teenage sufferer, who simply states, “Stay away from junk foods md stay fit”. It is estimated that all over the world, more than 140 million people have the disorder. According to the World Health Organization, that number could double by the year 2025. Experts say this could be the beginning of an epidemic.

Treatment for diabetes is made more difficult because a person cm have the disease, a long time before it is diagnosed. Early symptoms are relatively mild and as such diabetes often goes unrecognized. Hence, diabetes has been dubbed “the silent killer”.

Diabetes has been called “a disorder of the very engine of life” and for good reason. This is simply because the body machine is unable to carry out its function. When the body cannot break down glucose, a number of vital mechanisms can break down, sometimes with life threatening consequences. Dr Harvey has observed that people don’t die directly from diabetes rather they die from us complications. A good job can be done in preventing the complications but a poor job of treating them when they occur. The complications could include heart disease, stroke, poor kidney function, peripheral arterial disease and nerve damage. Poor blood supply to the feet can lead to ulcers which in severe cases require imputation of the limbs. Diabetes is also the most frequent cause of blindness in adults.

Although type one diabetes cannot be prevented, scientists are studying the genetic risk factors. They are trying to find ways to suppress an immune attack. Type two has a much brighter picture. Many of those who may be genetically susceptible avoid showing any sign of this disease. Simply be eating a balanced diet and exercising regularly, thereby staying physically fit and keeping their weight within normal limits.

Questions

1. Why is diabetes common among youths nowadays?
..... **1mk**
